

INTERVIEW BRIEF / CONTINUED

Questions, scorecard, and discovery hypotheses

Decision architecture

Release? Tune? Retrain? Roll back? Fallback? Escalate? Standardize? Stop? The role should make required evidence and intervention authority explicit at each decision.

120-day intent

1-30: Read and baseline.

31-60: Define Contract v0.1 and intervention rights.

61-90: Prove one production path end to end.

91-120: Scale reusable controls, operating review, capability plan, and roadmap.

Candidate scorecard - hypotheses, not company targets

Dimension	Candidate measure	Why it matters
Release flow	Lead time; frequency; change failure rate	Velocity without hiding production cost.
Reliability	SLO coverage; detection/recovery; alert quality	Failures are visible and recoverable.
Business value	Model-linked outcome and workflow adoption	Keeps optimization tied to work.
Economics	Training/inference cost; reuse; duplicate reduction	Makes scale choices explicit.
Trust & risk	Evidence coverage; ownership; auditability; exception aging	Controls live inside work.
Learning speed	Incident recurrence; lesson-to-control time	Turns pain into platform improvement.

Executive questions

- Which model classes or decisions are already business critical, and where does operational confidence lag experimentation?
- Where does a model become someone else's problem today - handoff, release, monitoring, data change, or incident response?
- Which failure mode has most shaped the current architecture: data reliability, drift, release friction, cost, auditability, or adoption?
- What authority should this role have to stop a release, require controls, or trigger rollback?
- How are model performance, workflow adoption, and business outcomes reconciled when they point in different directions?
- Are you hiring primarily for deep MLOps pedigree, or for a leader who can build the operating system around a technically strong platform organization?

Discovery hypotheses

Likely pressure points to test, not assert: fragmented ownership at DS/DE/platform/business handoffs; uneven model observability; platform standardization decisions; business-metric linkage; intervention and rollback authority; cloud/evaluation economics; adoption burden; and talent/capability mix.
